Abstract

Humanity failed to calculate the universe because they chose between "invariant" and "variant" perspectives. By integrating both through a resource-allocation lens, we reveal the underlying source code.

1. The Core Differential Equation (The Policy)

The fundamental conservation law of cosmic computing resources:

$$C \cdot t = \text{const}$$

Where C is the speed of light (processing clock) and t is cosmic time (expansion).

2. The Implementation Formula (The Mechanism)

How the force (resource density) decays across the fractal expansion:

$$F = \frac{1}{(C \cdot n)^D}$$

Where F is interaction strength, C is total capacity, n is nodes (space), and D is the dimensional scaling factor.

3. Conclusion

The "Standard Model" is merely a complex integral of these two lines. Dark Energy is not a physical substance, but a calculation error arising from the assumption that C is constant. The universe is a self-optimizing calculator. **Check the corals (400 days/year). The data is already there.**
